KARAN KANDU

Software Engineer | karankabir2002@gmail.com | +91 74838 03269 | LinkedIn: linkedin.com/in/karan-91076b228

PROFESSIONAL PROFILE

Java Backend Developer with 3.4+ years of stated experience in backend application development, REST API implementation, and enterprise application maintenance at TapQwik Software Private Limited. Experienced in developing application components for e-commerce product catalog management, order fulfillment, and hotel booking workflows. Skilled in Java, Spring Boot, Hibernate, Spring Data JPA, SQL, and layered application architecture, with a focus on business logic implementation, data persistence, request validation, and exception handling. Familiar with Redis caching, Kafka-based asynchronous processing, API testing, debugging, and code-quality practices. Committed to building maintainable backend components, improving data-access efficiency, resolving application defects, and collaborating with QA and development teams to deliver reliable software solutions.

TECHNICAL SKILLS

- **Programming**: Java, Core Java, Object-Oriented Programming, Collections Framework, Exception Handling, Stream API
- **Backend Development**: Spring Boot, Spring MVC, RESTful APIs, Layered Architecture, Request Validation
- **Persistence & Databases**: Hibernate, Spring Data JPA, JDBC, SQL, MySQL, MongoDB, Joins, CRUD Operations
- **Caching & Messaging**: Redis, Apache Kafka, Asynchronous Processing
- **Testing & Code Quality**: JUnit, Mockito, Debugging, Unit Testing, Code Reviews, Logging
- **Tools & Development**: Git, Maven, Postman, Swagger/OpenAPI
- **Cloud & Deployment**: Docker, AWS S3/RDS/Lambda, CI/CD Fundamentals
- **Engineering Practices**: Database Optimization, Exception Handling, Root-Cause Analysis, Code Maintainability
- **AI Tools & Developer Productivity:** GitHub Copilot, ChatGPT, Cursor AI, Code Explanation, Debugging, Testing

PROFESSIONAL EXPERIENCE

Software Engineer | TapQwik Software Private Limited

Jan 2024 – Present

- Develop and maintain Java-based backend components supporting product catalog, order fulfillment, and hotel booking workflows.
- Design, implement, and update RESTful APIs to support application operations, including request processing, input validation, business logic execution, and structured responses.
- Implement service-layer functionality using layered application architecture to maintain separation between controllers, business logic, and data-access components.
- Develop and maintain persistence logic for product, inventory, order, hotel, room, and booking-related records based on assigned module requirements.
- Work with Hibernate and Spring Data JPA, where applicable, to manage entity relationships, database interactions, and transaction-related operations.
- Investigate application defects by tracing request flows, reviewing logs, analyzing business logic, and validating corrective changes.
- Review SQL queries and data-access patterns to identify unnecessary database operations and opportunities to improve retrieval efficiency.
- Support Redis caching and Kafka-based asynchronous processing where used by assigned application modules.
- Perform API validation and regression testing to verify expected responses and reduce unintended impact on connected workflows.
- Follow established coding standards, participate in code reviews, and apply appropriate refactoring to improve readability and maintainability.
- Collaborate with QA engineers, developers, and project stakeholders to clarify requirements, resolve integration issues, and support feature delivery.

Software Engineer Trainee | TapQwik Software Private Limited

Jul 2023 – Dec 2023

- Worked on SQL/data retrieval tasks and debugging activities as assigned, while building familiarity with version control, build tools, and collaborative delivery practices. Assisted senior developers with understanding existing Java application modules, business workflows, and layered architecture.
- Supported the implementation and maintenance of REST API endpoints and service-layer functionality under technical guidance.
- Tested API endpoints using Postman and verified request and response behavior against expected requirements.

- Supported SQL queries and data-retrieval tasks for application functionality and issue investigation.
- Participated in debugging activities to identify implementation issues and understand application execution flows.
- Used Git and Maven, where applicable, to manage source changes and support build-related activities.
- Incorporated code-review feedback and followed team conventions for readable code, documentation, and testing.

PROJECT EXPERIENCE

Panasonic – Product Catalog & Order Fulfillment Management System

Project Description:

An e-commerce backend platform designed to manage product information, catalog retrieval, inventory data, and order fulfillment workflows. The application supports product discovery, order creation, request validation, order processing, and fulfillment status tracking through REST APIs. Backend components coordinate business logic and database operations to maintain consistency across product, inventory, and order records. The system follows a layered architecture to support maintainability, error handling, and reliable data processing.

Key Responsibilities & Complete Workflow

- Product Catalog Service: Supported product information retrieval, product detail management, and catalog data access through backend APIs.
- Product Search Service: Supported product lookup and category-based filtering, if included in the assigned module.
- Order Management Service: Implemented or maintained API workflows for receiving order requests, validating input, and processing order information.
- Inventory Management Service: Supported stock-related data retrieval and updates where inventory functionality was part of the application.
- Order Fulfillment Service: Supported order processing and fulfillment status updates across the order lifecycle.
- Database Integration: Used persistence components to store and retrieve product, inventory, and order records according to business requirements.
- Exception Handling: Supported request validation, error handling, and troubleshooting for invalid requests or unexpected application behavior.
- Testing & Code Quality: Validated API responses, investigated defects, and followed coding standards to maintain reliable and maintainable backend components.

FabHotels – Hotel Booking Management System

A hotel booking backend platform designed to manage property information, room details, availability-related data, and reservation workflows. The application supports hotel information retrieval, booking request processing, reservation record management, and booking status updates through backend APIs. Service-layer components handle business validations and coordinate database operations to support consistent booking information. The application emphasizes structured backend processing, error handling, and maintainable data access across hotel and reservation workflows.

Key Responsibilities & Complete Workflow

- Hotel Information Service: Supported retrieval and management of hotel details required by the application.
- Room Management Service: Worked with room-related information and associated property records where applicable.
- Room Availability Service: Supported availability-related data retrieval and validation if included in the assigned workflow.
- Booking Management Service: Maintained or supported booking APIs for receiving requests, validating input, and processing reservation details.
- Reservation Status Service: Supported reservation status updates and retrieval throughout the booking lifecycle.
- Database Integration: Used persistence components to retrieve and maintain hotel, room, and booking records according to application requirements.
- API Validation & Troubleshooting: Investigated API errors, validated request and response behavior, and supported corrective changes.
- Testing & Code Quality: Performed assigned functional or API testing, checked application behavior, and followed coding conventions to improve maintainability.

EDUCATION

B.Tech – Computer Science and Engineering (CSE) | Institute of Technology and Management, Gorakhpur

PROFESSIONAL STRENGTHS

- Backend problem-solving: break down business requirements into manageable API and service-layer tasks.
- Code maintainability: follow consistent naming, modular design, readable logic, and separation of concerns.
- Debugging mindset: trace issues through requests, logs, application logic, and data access to identify root causes.
- Team collaboration: communicate progress and blockers, incorporate review feedback, and coordinate with QA during validation.
